Furniture Lights - LED

Why Furniture Lights?

To optimise usability and functionality, furniture requires lighting with low power consumption and minimal heat generation. High heat generation can potentially damage both the furniture and the items stored or displayed within it. Whether it be in kitchen, office, wardrobe or retail displays, cabinets require lighting that operates with low power consumption and that generates minimal heat. The light design should be compact and minimal, with a sleek appearance and compatible with the board thickness of the furniture. In addition to these physical considerations, the aesthetic compatibility of the lighting with the furniture as a whole should also be taken into account. The lighting should subtly accentuate displayed products or complement the illumination of the surrounding space, thus enhancing the ambiance of the room while seamlessly blending with the furniture. Apart from their aesthetic contributions, furniture lights serve practical purposes as well. For instance, lights in cabinets or shelves can help illuminate the contents, making it easier to find and access items. Lights in drawers or closets can also increase visibility and help keep things organised. Furniture lights can improve safety by reducing the risk of accidents. For example, lights installed under bed frames or staircases can help prevent tripping and falling in the dark. Lights on the edges of furniture, such as tables or countertops, can also help prevent accidental bumps or collisions.

DIFFERENT PARAMETERS TO UNDERSTAND THE LIGHT BETTER

Furniture Lights - LED

Correlated Colour Temperature or CCT refers to the warmth or coolness of white light, measured in Kelvin (K).

LED Type SMD 2835 & SMD 3014 chips which are made with latest technology.

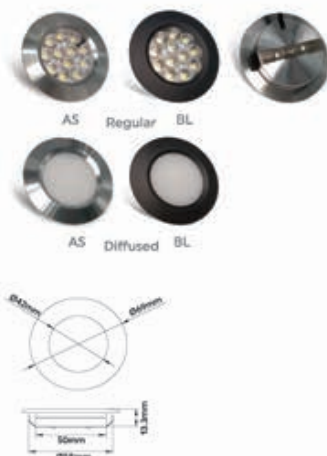

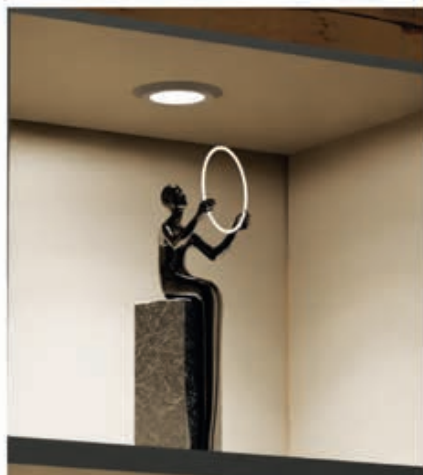

Colour Rendering Index (CRI) measures how accurately a light source displays colours compared to natural sunlight. Rated on a scale from 0 to 100, higher CRI values above 90 indicate excellent colour rendering.

Life Cycle is measured in operating hours. For example, a high-quality LED furniture light is rated for a lifecycle of 30,000 hours. Consequently, if one were to operate the LED light for 4 hours daily, it is projected to have a life cycle of approximately 20 years. It is important to note that the stated lifecycle of 30,000 hours considers that the LED is used at standard room temperature.
